

BESTLINK COLLEGE OF THE PHILIPPINES
College of Computer Studies
1071 Brgy. Kaligayahan Quirino Highway, Novaliches, Quezon City

COURSE CODE: PRAC101

Section: BSIT - 4102

COURSE TITLE: OJT / PRACTICUM 1

TERM: 1st Semester, SY 2025-2026

PROFESSOR: MR. EMERSON GELERA

NAME OF STUDENT: BADE, MATTHEW LOUIS DIAZ

OJT NARRATIVE REPORT

- A. TOPIC: Cybersecurity Session 6 : Security in Cloud Network Administration
- B. SPEAKER: MR. MARC TONIDO
- C. DURATION: 3:45 PM – 4:45 PM
- D. SCREENSHOT OF DUTY

BESTLINK COLLEGE OF THE PHILIPPINES

College of Computer Studies

1071 Brgy. Kaligayahan Quirino Highway, Novaliches, Quezon City

E. REFLECTION

Cybersecurity Session 6 : Security in Cloud Network Administration

In our Session 6 of Cybersecurity, we discussed Security in Cloud Network Administration, which focuses on how to keep cloud systems safe from different cyber threats. This topic is important because many companies today use cloud services to store data and run their applications. If the cloud is not secured properly, it can lead to serious problems like data leaks or hacking.

The lesson started with an introduction to cloud network security, which means protecting cloud-based systems, data, and applications from unauthorized access and attacks. Cloud security is very important because it ensures privacy, keeps data safe, and maintains trust between users and service providers. It also helps organizations follow laws and standards about data protection.

Next, we learned about the key concepts in cloud security, mainly the CIA Triad—Confidentiality, Integrity, and Availability. Confidentiality is about keeping data private through encryption and access control. Integrity ensures that the data is not changed or tampered with. Availability means making sure users can always access their data and services when needed. We also discussed other ideas like multi-tenancy, which means sharing cloud resources securely, elasticity and scalability that deal with resource changes, and the shared responsibility model, where both the provider and the user share security duties.

After that, we talked about the tools and techniques used to secure the cloud. Some examples are Virtual Private Cloud (VPC) for isolated networks, Identity and Access Management (IAM) to control user permissions, encryption for protecting data, and Multi-Factor Authentication (MFA) for extra login protection. We also learned about securing endpoints and keeping services updated with patches to avoid vulnerabilities.

Another important part was monitoring and compliance. Cloud monitoring tools like AWS CloudWatch or Azure Monitor help track activities in real time. Compliance ensures that cloud operations follow data protection laws such as GDPR or HIPAA. Audit logs are also useful for tracking changes and investigating any suspicious actions.

In conclusion, this session helped me understand that cloud security is a shared effort between users and providers. Administrators must stay alert and use different tools and techniques to protect data and systems. Proper configuration, regular monitoring, and following best practices are essential to keeping the cloud safe and trustworthy.
